Introduction & Current DXTRAN Approach

Description of Three Alternative DXTRAN Approaches

Results

Summary

## Background & Introduction

---

***Primary objective: Assess Monte Carlo figure of merit (FOM) of alternative nested DXTRAN projection approaches that create DXTRAN particles less aggressively than the current approach***

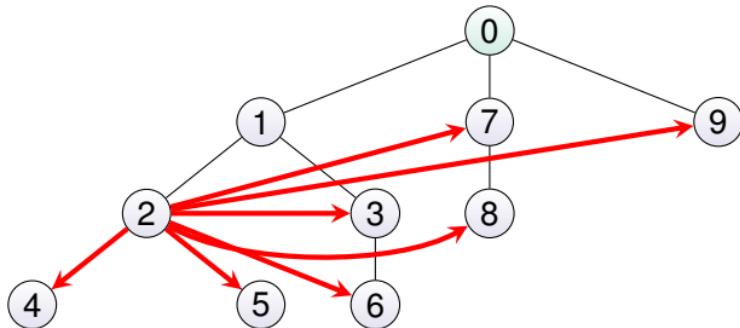

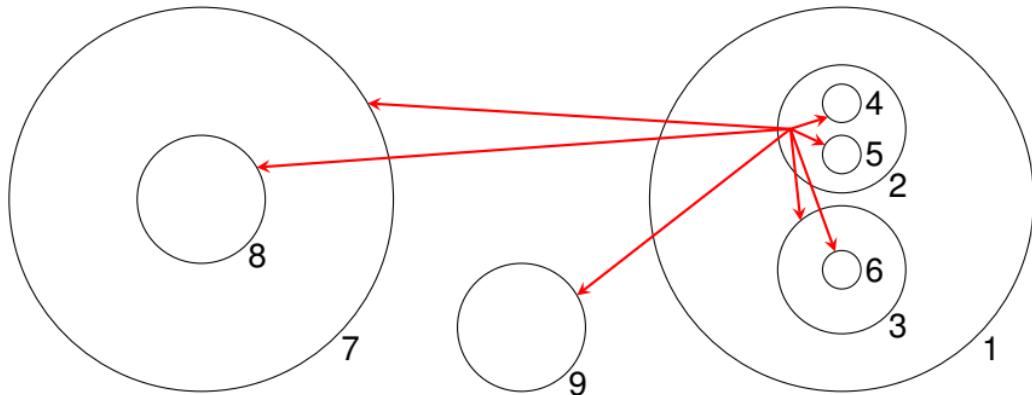

- ▶ Multiple, nested, MCNP DXTRAN spheres became available in MCNP6 Beta 2 (Goorley et al., 2012)
  - ▶ Effectiveness demonstrated with two test cases: 1-km air transport and concrete duct (Booth et al., 2009)
- ▶ Currently, when DXTRAN is performed a DXTRAN particle is created on every possible sphere with weight correction

$$w_{DX} = w \frac{p(\mu)}{\tilde{p}(\mu)} \exp(-\lambda) \quad (1)$$

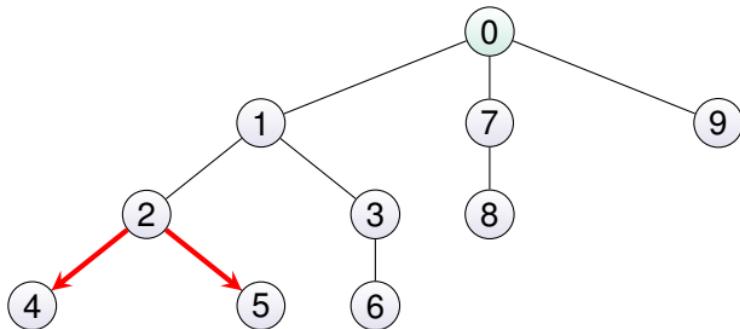

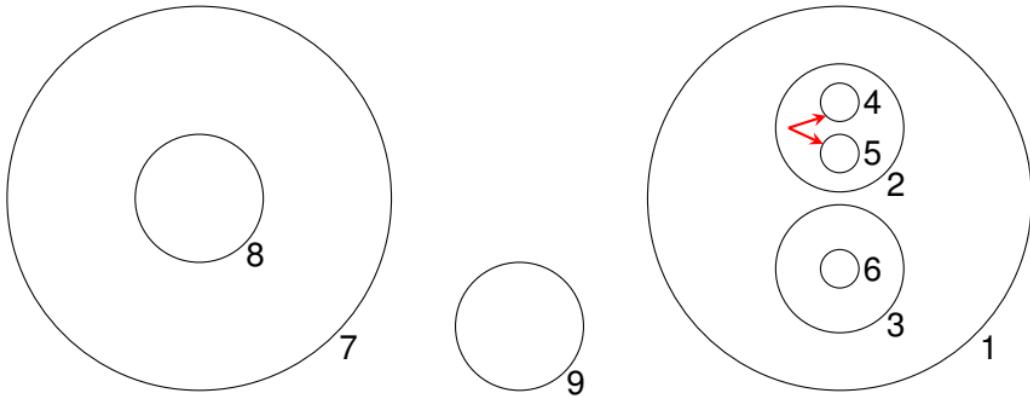

- ▶ No assessment has been made for less-aggressive schemes on FOM,

$$FOM = \sigma^{-2} T^{-1} \quad (2)$$

# Current Nested DXTRAN Approach

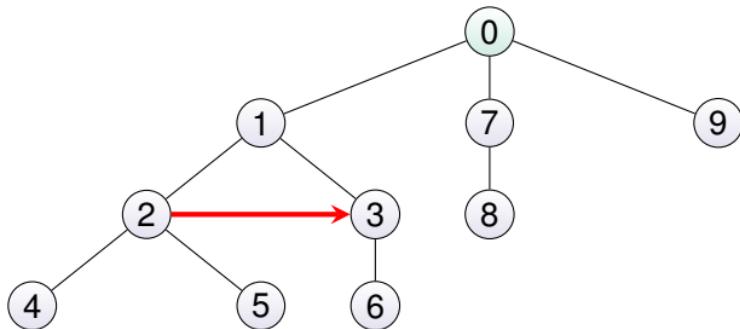

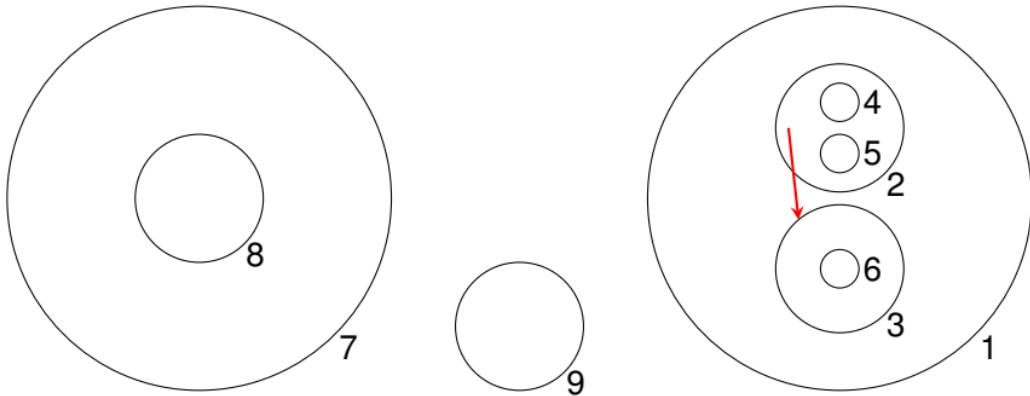

## Alternative Approach 1

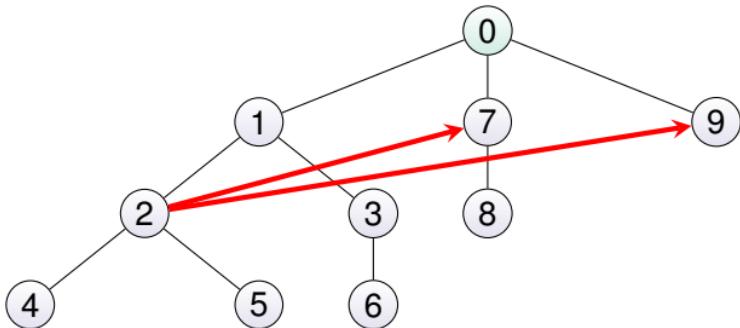

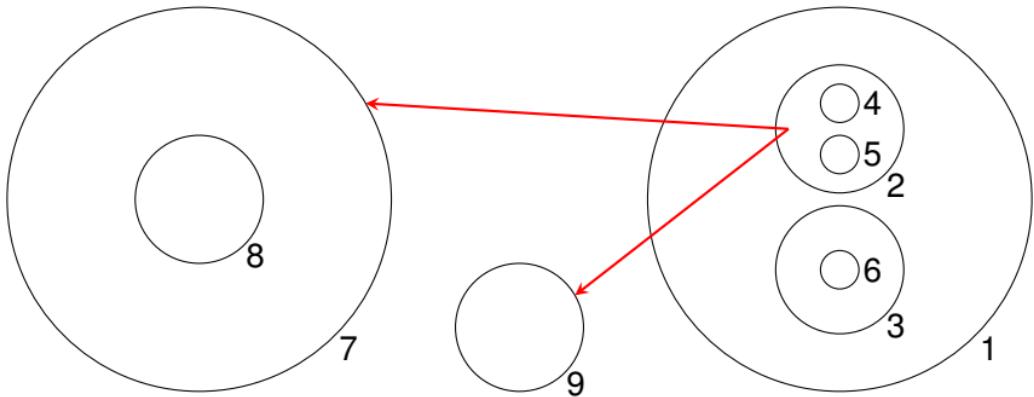

UNCLASSIFIED

## Alternative Approach 2

UNCLASSIFIED

## Alternative Approach 3

# Fairness Assessment

- ▶ Fairness Assessment
  - ▶ Approach 1: May have minor bias, not investigated further
  - ▶ Approaches 2 & 3: Agrees with analog / traditional DXTRAN

## Summary

---

- ▶ Three alternative, less-aggressive, DXTRAN projection schemes tested
  - ▶ Combined schemes and compared with analog / traditional DXTRAN
  - ▶ One scheme may have bias; not investigated further
  - ▶ In arbitrary geometries, there can be FOM improvement
  - ▶ In more-complicated geometries, there is likely FOM degradation
- ▶ None of the tested approaches give consistently superior FOM behavior
  - ▶ Not examined: no treatment projects to innermost spheres
  - ▶ Not tried because this negates the effect of multiple nested spheres
- ▶ Ensuring unbiasedness is more complicated (more edge cases)

**Conclusion: Stay with current nested DXTRAN treatment**
